Active Directory Authentication

Active Directory Operator Authentication

WinDSX SQL can now utilize complex logins and passwords facilitated by Active Directory in Windows™. Operator Logins can be authenticated by Active Directory instead of WinDSX. To configure this, the WinDSX SQL Operators use the same Login Name as they do in Windows™. Their Login name is entered like always under Operator Passwords. The Operator is assigned a Password Profile but is not assigned a Password. When WinDSX SQL receives a login from an operator that does not have a password in its database it sends the login request to Active Directory (AD) for authentication. If AD authenticates the operator they are given access to WinDSX SQL according to the Password Profile assigned to them.

Operator: Rusty Gibson

General

Operator Name: Rusty Gibson

Password: [masked]

Confirm Password: [masked]

Password Profile: Master

Notes: Fill in the Operator Name field above with the Windows Logon to be used. Skip the Password fields and select the appropriate Password Profile.
