

WINDSX DAILYOPS

OVERVIEW

Daily Ops is a process that occurs once a day at midnight, traditionally from the Communications Server PC.

Daily Ops initiates several automated processes including:

1. Evaluation and modification of Cards with
 - Pending Start or Stop Dates and Times
 - Temporary Access Levels
 - Assigned with a "Use it or Lose it" parameter
2. Backups of DataBase and/or History if the system is configured for automated backups
3. API Card Holder Import (delays are built in to prevent the import from monopolizing the processor)

OPTIONS

By default, the Daily Ops routine is assigned to the Comm Server. However, WinDSX Versions 3.6.4 / 4.6.4 and higher can assign the Daily Ops routine to any Workstation.

The Workstation PC that will be running DailyOps:

- Will run all DailyOps
- Is a dedicated machine - not used for anything else
- Runs Db.exe/DbSql.exe as a Service
- In the Shared DataBase folder, has a text file named DailyOps.txt that identifies the Workstation number of the PC required to run Daily Ops
- Will constantly check for API Import files and remove delays built into the Import routines.
- Will drastically reduce the amount of time to import large amounts of data.
